

MINIMALLY INVASIVE KNEE (MIK) RETRACTOR SYSTEM

Our **Minimally Invasive Knee (MIK) Retractor System** is based on clinical use and surgeon feedback. The complete system features custom silicone handles for maximum function and comfort and unique shapes for MIK surgery.

The MIK Retractor System addresses several factors necessary for successful Total Knee Replacement (TKR) Surgery and Unicompartmental Knee Replacement (UKR). Visibility during a minimally invasive approach is critical to ensure proper bone resections, ligament balancing and implant placement.

The MIK Retractors also protect soft tissue and ligaments. Several of the instruments are designed to provide retraction and also help prevent the saw blade from cutting through ligaments on the opposite side of the incision site.

MINIMALLY INVASIVE KNEE (MIK) RETRACTOR SYSTEM

Part Numbers

Small Hohmann Retractor

13-035-000

Used during initial dissection and designed to improve exposure of proximal tibia.

Large Hohmann Retractor

13-036-000

Wide Hohmann style blade for general retraction of large muscle groups.

Condylar Retractor

13-037-000

"J" curved blade used to retract soft tissue surrounding medial and lateral tibia during dissection.

Superior Retractor

13-038-000

Gentle radius of retractor designed to retract superior capsule without placing undue stress on skin incision.

Patellar Retractor

13-039-000

Windowed retractor blade captures patella, minimizing tension to patellar tendon and eliminating need for patellar eversion.

Collateral Retractor

13-040-000 (left)
13-041-000 (right)

Protect medial and lateral collateral ligaments from saw blade during proximal tibial resection.

Soft Tissue Retractor

13-042-000

Versatile soft tissue retractor used during exposure and initial bone resections.
